

AOD-9604

AOD-9604 is a modified form of amino acid numbers 176-191 of human growth hormone protein. Investigators at Monash University discovered that the fat-reducing effects of HGH appear to be controlled by a small region near one end of the hormone.

As a result, AOD-9604 is utilized as an anti-obesity drug, to trigger areas with abnormally high levels of fat deposits in the body. It has the same benefits as HGH; however, it does not target the blood sugar levels or IGF-1 levels in the same manner. So, individuals who are using this injection, aren't going to feel the side effects they might experience if they are using HGH growth hormones to help them achieve their weight loss goals over time.

AOD-9604 also works to help regulate the body's metabolism. It will help speed up the metabolism, meaning greater fat burning, calorie-burning, and greater weight loss results in a shorter period of time. By destroying fat cells, the body can target revving up the metabolism as well as inhibiting lipogenesis.

Individuals are going to experience the greatest results if they are following a lower calorie diet and are exercising. This will help promote greater weight loss results and will ensure higher caloric burn throughout the day. The regenerative powers of AOD-9604 have also been noted to help individuals who suffer from conditions like osteoarthritis and osteoporosis. It can help improve bone strength and help prevent wear and tear on the joints and muscles over time.
