

**Epitalon**, also known as the longevity peptide, is a highly potent synthetic tetrapeptide analog of the natural substance (Epithalamin) produced by the human pineal gland. Epitalon (also known as Epithalon or Epithalone) is the synthetic version of the polypeptide Epithalamin which is naturally produced in humans.

Epitalon works by restoring the functions of the neuroendocrine system, increasing the resources of the cell, stimulating the production of melatonin, and reducing negative age-related alternations.

Epithalamin increases a person's resistance to emotional stress and also acts as an antioxidant. It is a bio-regulator for the endocrine system, especially for the pineal gland, and has been shown to lengthen telomeres (which influence longevity) in human cells.

### **Benefits of using Epitalon:**

- Epitalon slows the aging process
- Epitalon rejuvenates the body
- Epitalon promotes normal sleep
- Epitalon normalizes metabolism
- Epitalon postpones menopause
- Epitalon restores hormonal balance
- Epitalon has shown promise as a treatment for liver disorders
- Epitalon lowers emotional stress
- Epitalon improves the natural aspects of the circadian rhythm
- Epitalon activates telomerase and thereby increases longevity.
- Epitalon provides protective effects in lowering heart disease and cancer
- Epitalon reduces lipid oxidation and helps normalize cholesterol
- Epitalon normalizes uric acid levels, prolactin levels, and T cell function
- Epitalon has shown promise as a treatment for liver disorders
