

ADVANCED MUSCLE BUILDING OPTIONS

Testosterone Optimization:

Nandrolone (*Deca-Durabolin*) is a synthetic anabolic steroid that is beneficial in the treatment of male health alone, or as an adjunct to TRT for men. Nandrolone has a relatively long half-life in the plasma and a strong binding affinity for androgen receptors. Effects from Nandrolone alone, or in conjunction with other anabolic steroids include pronounced muscle gain as well as significant increases in strength. (10ml) (plus syringes/supplies)

Oxandrolone (*Anavar*) is a synthetic anabolic steroid that comes in an oral form. It is best known for building muscle, improving endurance, and making muscles more defined. It is believed to be the most harmless synthetic anabolic steroid with regards to unwanted side effects or negative reactions. It is extremely popular in athletes, as it is considered one of the best anabolic steroids used during the cutting phase and to accelerate intensive weight loss. In general, it has a number of incomparable advantages against other steroid analogs. (#84)

Testosterone Cypionate: Testosterone cypionate is a pharmaceutical form of testosterone used for optimizing low testosterone. In the context of restoring testosterone levels to a healthy range, testosterone cypionate is a highly beneficial form of hormone replacement therapy and well-tolerated by most patients. It is a relatively long-acting form of testosterone and doses should last 7-8 days. (2 ml and 10ml) (plus syringes/supplies)

Testosterone Propionate: Testosterone propionate is a pharmaceutical form of testosterone used for optimizing low testosterone or added to other forms of testosterone. It is a short-acting form of testosterone and doses should last 2-3 days. Compared to other anabolic steroids, testosterone propionate is able to normalize androgen receptors to increase the androgenic effect of the drug. (10 ml) (plus syringes/supplies)

Increasing metabolism / Losing Fat / Building Muscle:

CJC-1295 / Ipamorelin or IGF-1(LR3)/CJC-1295/Ipamorelin: *CJC-1295* stimulates the release of HGH and IGF-1 leading to fat loss and increased protein synthesis thereby promoting muscle growth. *CJC-1295* without Drug Affinity Complex (DAC) provides a more effective GH spike resembling a normal physiologic release of GH. *Ipamorelin* is a Growth Hormone Releasing Peptide (GHRP) that assists in increasing the amount of growth hormone released. *Ipamorelin* is widely known for being able to suppress somatostatin as well. Using *CJC-1295* with *Ipamorelin* is more effective in the production of growth hormone secretion, and in helping speed recovery time after an injury. The addition of **LR3-IGF-1*** is associated with increasing insulin sensitivity, reducing weight and increasing metabolic expenditure. (2 ml) / (5 ml) OR (6 ml [LR3 added]) (plus syringes/supplies)

Ibutamoren Mesylate (MK-677): *Ibutamoren* is a non-peptide growth hormone secretagogue and mimics the growth hormone stimulating action of ghrelin. It is potent, long-acting, and available through oral administration. It has been demonstrated to increase the endogenous release of human growth hormone (HGH) as well as insulin-like growth factor 1 (IGF-1) without the adverse increase of prolactin or cortisol often seen with GHRPs. Additionally, increases in lean body mass can be achieved while lowering LDL cholesterol. Studies have shown *Ibutamoren* stimulates brain regions involved with metabolic action, such as the hypothalamus and the pituitary. *Ibutamoren* may be effective in increasing both muscle mass and bone mineral density. (#30) / (#90)

Sermorelin: Sermorelin works to burn fat by stimulating the production and release of hormones by the pituitary. Combined with Glycine, it makes the ideal synergistic formula to help your body to burn fat. Combined with Ipamorelin, it increases the production and release of growth hormone to maintain muscle mass.

Sermorelin with Glycine: (7.5 ml) **Sermorelin with Ipamorelin:** (6 ml) (plus syringes/supplies)

MOTS-c: MOTS-c regulates skeletal muscle and fat metabolism leading to weight loss, enhances glucose metabolism/decreases insulin resistance/enhances glucose uptake in muscle, accelerates bone fracture healing, enhances energy and performance which promotes exercise endurance. (4 [1ml] vials) (plus syringes/supplies)

PEG-MGF: Mechano-growth factor (MGF) is found in muscle, bone, tendon, neural, and cardiac tissue following periods of increased stress. It is an isoform of insulin-like growth factor-1 (IGF-1). MGF functions to increase stem cell proliferation in given tissues, allowing for more rapid recovery. (5 ml) (plus syringes/supplies)

AOD-9604: AOD-9604 has a strong fat-burning capacity and acts independently of growth hormone. It works to reduce the accumulation of new fat in fat cells as well as increasing fat burning. AOD-9604 also possesses regenerative properties and assist with osteoarthritis, bone/cartilage repair and pain. (5ml) (plus syringes/supplies)

SARMs / SERMs:

Enclomiphene: Enclomiphene citrate increases total and free testosterone. It normalizes endogenous testosterone production pathways and restores normal testosterone levels in men. It is an oral medication that acts as a selective receptor modulator. It is an excellent option for those wishing to avoid injections while improving testosterone levels. It is equally an excellent option for post-cycle therapy when deciding to stop exogenous testosterone for a time. (1 month supply [60 Capsules])

Human Growth Hormone:

Norditropin / Omnitrope*: Growth hormone (GH) also known as human growth hormone (HGH) in its human form, is a peptide/hormone that stimulates growth, cell reproduction, and cell regeneration in humans and other animals. (5.8 mg per vial / 2-week supply) (plus syringes/supplies)

Increasing utilization / mobilization of fat:

Fat Loss Cream (Aminophylline/Glycyrrhetic acid): Aminophylline and glycyrrhetic acid transdermal cream is used for fat loss. Aminophylline and glycyrrhetic prevent cAMP breakdown. Cyclic AMP (cAMP) functions in several biochemical processes including the regulation of glycogen, sugar, and lipid metabolism. (60 ml)

MIC / B Complex / L-Carnitine: Methionine helps the liver break down fats, lowers cholesterol and relieves fatigue. Inositol helps the breakdown of fats, lowers cholesterol, and helps control mood and appetite. Choline helps the liver break down fats and excrete toxins. B12 boosts energy, assists in the burning of stored body fat, helps detox, and helps regulate sleep, mood, and appetite. L-Carnitine assists in converting body fat to fuel and elevate enzymes needed to metabolize sugars, starches, and other carbohydrates. (30 ml) (plus syringes/supplies)

GOAL (Glutamine, Ornithine, Arginine and Lysine): GOAL is an amino acid blend that is utilized for weight loss and endurance. This combination is often the power punch patients are looking for to improve overall health while improving body composition encouraged by improved metabolic function resulting in weight loss. (30 ml) (plus syringes/supplies)

GACLIV (Glutamine, Arginine, Carnitine, Leucine, Isoleucine and Valine) GACLIV is an amino acid blend containing the specific branched-chain essential amino acid that promotes muscle growth and decreases muscle wasting. It assists in athletic performance and recovery from exercise. It is also helpful in burning fat and improving blood sugar levels. (30 ml) (plus syringes/supplies)
