

ANTI-AGING MEDICINE OPTIONS

Increasing Metabolism / Losing Fat / Building Muscle:

CJC-1295 / Ipamorelin or IGF-1(LR3)*CJC-1295/Ipamorelin: CJC-1295 stimulates the release of GHG and IGF-1 to stimulate fat loss and promote muscle growth. Using CJC-1295 with Ipamorelin is more effective in the production of growth hormone secretion, and accelerates recovery time after injury. The addition of LR3-IGF-1* is associated with increasing insulin sensitivity, reducing weight and increasing metabolic expenditure. (2 ml) / (5 ml) or (6 ml *[LR3 added]) (plus syringes/supplies)

Sermorelin works to burn fat by stimulating the production and release of pituitary gland hormones. Combined with Glycine, it makes the ideal synergistic formula to help your body to burn fat. Combined with Ipamorelin, it increases the production and release of growth hormone to maintain muscle mass.

Sermorelin with Glycine: (7.5 ml) **Sermorelin with Ipamorelin:** (6 ml) (plus syringes/supplies)

Ibutamoren Mesylate (MK-677): Ibutamoren is a non-peptide growth hormone secretagogue and mimics the growth hormone stimulating action of ghrelin. Increases in lean body mass can be achieved while lowering LDL cholesterol. Studies have also shown Ibutamoren stimulates brain regions involved with metabolic action, such as the hypothalamus and the pituitary. Ibutamoren may be effective in increasing both muscle mass and bone mineral density. (#30) / (#90)

MOTS-c: MOTS-c regulates skeletal muscle and fat metabolism leading to weight loss via fatty acid oxidation, enhances glucose metabolism/decreases insulin resistance/enhances glucose uptake in muscle, accelerates bone fracture healing, enhances energy and performance which promotes exercise endurance. (1 ml vials / Total of 4 vials plus syringes/supplies)

Hormone Optimization:

Human Growth Hormone (HGH): Human growth hormone (HGH) in its human form, is a peptide / hormone that stimulates growth, cell reproduction, and cell regeneration in humans and other animals. When growth hormone is released from the pituitary gland, it signals the liver to release insulin-like growth factor-1 (IGF-1). Together, growth hormone and IGF-1 tell the bones, muscles, and other organs and tissues to grow by adding more cells. (5.8 g per vial / 2-week supply)

Testosterone Replacement Therapy (TRT): TRT is used for optimizing low testosterone. In the context of restoring testosterone levels to a healthy range, testosterone cypionate is a highly beneficial form of hormone replacement therapy and well-tolerated by most patients. (10ml) (plus syringes/supplies)

Bioidentical Hormone Replacement (Estrogen/Testosterone): By correcting age-related hormone decline with appropriate doses of bioidentical hormones like testosterone, estrogen, and progesterone, we can give you the balanced hormones of a much younger person. This will not only relieve menopause symptoms, but also promote better overall health, youthful appearance and function. (30 days) / (90 days)

Insomnia / Sleep Disturbances:

Delta Sleep Inducing Peptide (DSIP) helps induce better sleep and relieve emotional and psychological responses to stress. In addition, DSIP has several physiological effects including modification in thermoregulation, heart rate, blood pressure as well as pain threshold. (3ml) (plus syringes/supplies)

Longevity / Anti-Aging:

Epithalon is the classic anti-aging peptide. It acts to elongate DNA ends, which is associated with longevity. It also has an effect on lowering oxidation pathways, which speeds up the aging process. In addition, it has been shown to improve immunity, insulin sensitivity and tissue repair. In studies, patients using Epithalon had decreased mortality and increases in life expectancy. (5ml) (plus syringes/supplies)

Sexual Health and Wellness:

Oxytocin (known as the "love hormone") has been shown to make orgasms more enjoyable. Individuals reported more intense orgasms, greater levels of contentment and greater satisfaction after sex. (#30)

Tadalafil (Cialis) with Apomorphine: Apomorphine enhances signals that relax smooth muscle and allow erections to happen more easily. Tadalafil combined with Apomorphine is more effective in increasing sexual desire, sexual arousal, sexual orgasm and sexual satisfaction.

Tadalafil (Cialis) with Oxytocin and PT-141: In this triple combination, Tadalafil is enhanced with the addition of Oxytocin, the "love hormone" which has been shown to make orgasm more intense along with PT-141 to enhance sexual arousal and orgasm. This combination is perfect for heightened sexual desire and sexual arousal culminating with more intense orgasms for both men and women.

Increasing memory and focus:

Dihexa improves cognitive function while enhancing acquisition, consolidation and recall of learning and memory. It was found to be seven times more potent than brain-derived neurotrophic factor. (#30)

Selank has anxiolytic activity and acts as a stable neuropsychotropic, antidepressant, and anti-stress drug. It also has a nootropic action, which positively influences the formation of memory and learning processes. It has been shown to have marked immunomodulatory activity. (3 ml nasal spray)

Semax is a nootropic peptide that affects the learning processes and exploratory behavior. It also influences neurological regeneration and development, pain perception and the inflammatory processes, as well as neuromuscular performance. (3 ml nasal spray) / (5ml) (plus syringes/supplies)

Aesthetic Dermatology:

GHK-Cu: Studies indicate that GHK-Cu has a variety of roles in the body including activation of wound healing, activation of immune cells, antioxidant/anti-inflammatory effects, stimulating collagen and promoting blood vessel growth. Facial Cream (15 g) / Injection (5ml vial)

PTD-DBM is a follicle regeneration treatment. It is a peptide-based topical scalp treatment that inhibits the follicle shrinking action of the body's hormones and enzymes effectively rescuing the follicle at a stem cell level. Treatment with PTD-DBM both prevents hair loss and promotes the growth of new hair follicles. (25 ml spray bottle)

Zn-Thymulin/GHK-Cu is a combination therapy treatment for hair loss. Zn-Thymulin adds to the healing properties of GHK-Cu by enhancing hair growth and darkening hair pigmentation by limiting DHT conversion and increasing the anagen phase (active phase) of hair growth. (25 ml spray bottle)
